At least a part of surface of each bar is deformed prior to or during the curing stage of the matrix by means of: a) one or more strings of an elastic or inelastic, but tensioned material being helically wound around said at least one bundle of parallel, straight fibers prior to curing of the matrix in which the fibers are embedded, maintaining the fibers in an parallel state during curing and providing an uneven external surface in a longitudinal direction of the reinforcement bars, and/or b) at least one deformed section and/or at least one end of each reinforcement bar; thereby producing a roughened surface. The invention also relates to a method for manufacturing reinforcement bars and for use of such short fibers.

(57) An invention concerns an anti-noise barrier 20, 21 and assembly method thereof. The foundation and the structural post of the barrier are a single continuous piece in the shape of a sheet pile 2. The sheet pile comprises a first part 2' and a second part 2'' of such a length that, in use, the second part 2'' results insertable on the ground 50 to realize the foundation, while, contextually, the first part 2' results emerging from the ground upwards. The first part of the sheet pile 2', besides, is provided with connection means 4, 5 through which to be able to connect the sound-absorbent panels 6, and with a plate 3 on which to lean the panels themselves in such a way that the arrangement on the ground of the foundation and of the structural post results realizable in a single phase to then proceed with the second phase of application of the panels.
